

Barcode No **87139809**
Patient Name **Mrs.DARSHANA RANI**
Age/Sex **59 YRS/Female**
Referred By **DR. SELF**

Lab No **16952408260005**
Reg Date **26/Aug/2024 03:39PM**
Sample Coll. Date **26/Aug/2024 02:42 PM**
Sample Rec.Date **27/Aug/2024 08:02 AM**
Report Date **27/Aug/2024 12:27PM**

.IMMUNO BIOCHEMISTRY-1

Test Name With Methodology	Result	Unit	Biological Ref.Interval
ACE (Angiotensin Converting Enzyme)			
ACE [Angiotensin Converting Enzyme] Serum, Spectrophotometry	31.3	U/L	8-52

Comments:

An increased ACE level in a person who has clinical findings consistent with sarcoidosis means that it is likely that the person has an active case of sarcoidosis, if other diseases have been ruled out. A normal ACE level cannot be used to rule out sarcoidosis because sarcoidosis can be present without an elevated ACE level. Findings of normal ACE levels in sarcoidosis may occur if the disease is in an inactive state, may reflect early detection of sarcoidosis, or may be a case where the cells do not produce increased amounts of ACE. ACE levels are also less likely to be elevated in cases of chronic sarcoidosis.

High and low levels of ACE may be seen in a variety of conditions other than sarcoidosis.

ACE has been found in moderately increased levels in a variety of diseases and disorders, such as:

- HIV
- Histoplasmosis (fungal respiratory infection)
- Diabetes mellitus
- Hyperthyroidism
- Lymphoma
- Alcoholic cirrhosis
- Gaucher disease (a rare inherited lipid metabolism disorder)
- Tuberculosis
- Leprosy

Decreased ACE levels may also be seen in people with:

- Chronic obstructive pulmonary disease (COPD)
- Lung diseases such as emphysema, lung cancer, cystic fibrosis
