IMMUNOASSAY

Test Name With Methodology	Result	Unit	Biological Ref.Interval
ANA/ANF (Anti Nuclear Antibodies) ELISA			
ANA Serum, ELISA	13.52	UNITS	<20 Negative 20-60 Moderate Positive >60 Positive

Comment:

The ANA test is recommended to help screen for autoimmune disorders and is most often used as one of the tests to diagnose systemic lupus erythematosus (SLE) along with erythrocyte sedimentation rate (ESR) and/or C-reactive protein (CRP) .

A positive ANA test result may suggest an autoimmune disease, but further specific testing is required to assist in making a final diagnosis. ANA test results can be positive in people without any known autoimmune disease. While this is not common, the frequency of a false positive ANA result increases as people get older. A positive ANA can also mean that the patient has drug-induced lupus. This condition is associated with the development of autoantibody to histones, which are water soluble proteins rich in the amino acids lysine and arginine. An anti-histone test may be ordered to support the diagnosis of drug-induced lupus.

A negative ANA result makes SLE an unlikely diagnosis. It usually is not necessary to immediately repeat a negative ANA test; however, due to the episodic nature of autoimmune diseases, it may be worthwhile to repeat the ANA test at a future date.

 Dr Vikas S. (MBBS, MD, DNB Micro)
 (Consultant Microbiologist)

 Dr Prashant Goyal (DCP)
