IMMUNOASSAY

Test Name With Methodology	Result	Unit	Biological Ref.Interval
ACTH (Adreno Cortico Tropic Hormone)			
ACTH CLIA	20.4	pg/mL	6-48

Note: Since secretion of ACTH is both pulsatile and circadian in nature, it is recommended to draw ACTH samples between 7-10 a.m.

Comments

ACTH is a hormone produced in the pituitary and stimulates steroid production in adrenal cortex. Its secretion is controlled by the hypothalamic CRF and by negative feedback from cortisol. ACTH values are valuable in differential diagnosis of adrenal insufficiency/hypersecretion. In primary adrenal insufficiency, elevated levels are typical. Low levels are the rule when adrenal insufficiency is secondary to pituitary dysfunction. ACTH determination can also help to identify the cause of cortisol hypersecretion in Cushing's syndrome.

ACTH levels are lowered when this is due to lesion or hyperplasia of adrenal cortex and high when it is due to ectopic ACTH production or pituitary hypersecretion.

Cortisol [Morning] Serum, Electro Chemi Luminescent Immuno Assay	.IMMUNO BIOCHEMISTRY-1 8.55	$\mu\text{g/dL}$	4.82 - 19.5

COMMENTS:

Cortisol is produced and secreted by the adrenal glands. Cortisol is a hormone that plays a role in the metabolism of proteins, lipids, and carbohydrates. It affects blood glucose levels, helps maintain blood pressure, and helps regulate the immune system. The level of cortisol in the blood (as well as the urine and saliva) normally rises and falls in a "diurnal variation" pattern. It peaks early in the morning, then declines throughout the day, reaching its lowest level about midnight. This pattern can change when a person works irregular shifts (such as the night shift) and sleeps at different times of the day, and it can become disrupted when a disease or condition either limits or stimulates cortisol production.
