

HEXAMED

DIAGNOSTICS & SPECIALTY CLINICS

Your Right to Right Healthcare...

Laboratory | Radiology | Polyclinic | Pharmacy

Barcode No	87943650	Lab No	16952411200003
Patient Name	Mrs.FAREEDA MIR	Reg Date	20/Nov/2024 02:59PM
Age/Sex	60 YRS/Female	Sample Coll. Date	20/Nov/2024 02:04 PM
Referred By	SELF	Sample Rec.Date	21/Nov/2024 08:06 AM
Client Code/Name	AP081899 Hexamed Healthcare Services LLP		
Ref. Lab/Hosp		Report Date	21/Nov/2024 10:54AM

.IMMUNO BIOCHEMISTRY-1

Test Name With Methodology	Result	Unit	Biological Ref.Interval
CA-19.9 (Pancreatic Cancer Marker)			
CA 19.9	1.22	U/mL	<39.0

Serum, Electro Chemi Luminescent Immuno Assay

Comment:

Carbohydrate antigen or Cancer antigen 19-9 (CA 19-9) is a modified Lewis(a) blood group antigen; and has been used as a tumor marker. An increase in the assay value of CA - 19.9 is frequently found in certain types of cancer (Pancreas, Colorectal), but also in certain non-cancerous pathologies also. The CA - 19.9 assay is used as an additional test for the prognosis & monitoring of therapy of patients with diagnosed malignant tumours. The CA - 19.9 assay level decreases after therapy & increases in cases of relapse, residual disease & metastasis.

Dr. Prashant Goyal (DCP)
(Director & Chief Pathologist)

Test Name With Methodology	Result	Unit	Biological Ref.Interval
Carcino Embryonic Antigen (CEA) Carcinoembryonic Antigen (CEA) Serum, Electro Chemi Luminescent Immuno Assay	11.10	ng/mL	Smokers: <5.0 Nonsmokers: <3.0

COMMENTS:

Carcinoembryonic antigen (CEA) is a glycoprotein involved in cell adhesion. The carcinoembryonic antigen (CEA) test measures the amount of this protein that may appear in the blood of some people who have certain kinds of cancers, especially large intestine (colon and rectal) cancer. It may also be present in people with cancer of the pancreas, breast, ovary, or lung. The CEA test is not useful for diagnosing or screening the general population for cancer. CEA testing is not used to diagnose cancer, but it may assist doctors in predicting how a person's cancer may be likely to progress, determining treatment effectiveness, and assessing whether or not cancer has returned after treatment.

Elevated CEA levels can show some non-cancer related conditions, for example, include stomach ulcers, pancreatitis, smoking, lung infection, inflammatory bowel diseases like ulcerative colitis or diverticulitis, liver scarring, and gallbladder inflammation. Elevated serum CEA levels have also been detected in patients with non-malignant disease, especially patients who are older. False negative / positive results are observed in patients receiving mouse monoclonal antibodies for diagnosis or therapy.

CEA levels generally fall to normal or near normal levels within one to four months after surgical removal of cancerous tissues. A rise in CEA levels may be first indication of recurrence and may precede physical science symptoms. Serial CEA levels are also useful in assessing the effectiveness of therapy or possible metastasis. CEA is a useful tool for monitoring and managing cancer therapy and provides the clinician with additional about patient prognosis.

The concentration of CEA in a given specimen as determined by assays from different manufacturers can vary due to differences in assay methods and reagent specificity. Values obtained with different assay method cannot be used interchangeable.
