IMMUNOASSAY

Test Name With Methodology	Result	Unit	Biological Ref.Interval
Anti Mullerian Hormone (AMH)			
Anti Mullerian Hormones	1.47	ng/ml	1.22 -11.7

Serum ECLIA

Comment:

Group	Age in Years	Normal Ref Range of AMH (ng/ml)
Female	< 24	1.22 - 11.7
	24-29	0.890 - 9.85
	29-34	0.576 - 8.13
	34-39	0.147 - 7.49
	39-44	0.027 - 5.47
	44-50	0.010 - 2.71
Male		0.77 - 14.5

This test is used to estimate the levels of Anti Mullerian Hormone (AMH). This helps in evaluating the fertility potential, measuring ovarian aging and predicting the onset of menopause. Besides, it helps in diagnosis of Polycystic ovary syndrome.

Serum levels of AMH are barely detectable at birth in females, reach their highest levels after puberty, decrease progressively thereafter with age, and become undetectable at menopause. Serum AMH levels have been shown to be relatively stable during the menstrual cycle with substantial fluctuations being observed in younger women. Serum AMH levels decrease significantly during the use of combined contraceptives.

For diagnostic purposes, the results should always be assessed in conjunction with the patient's medical history, clinical examination and other findings. Samples should not be taken from patients receiving therapy with high biotin doses (i.e. > 5 mg/day) until at least 8 hours following the last biotin administration.
