IMMUNOLOGY SPE

Test Name With Methodology	Result	Unit	Biological Ref. Interval
Dual Marker			
PAPP-A (Pregnancy Associated Plasma Protein A) Chemiluminescent immunoassay (CLIA)	2262.2	ng/ml	
Beta Hcg Titer Chemiluminescent immunoassay (CLIA)	197677	mIU/mL	

Statistical evaluation of **Dual Marker** has been done using **Benetech PRA software**.

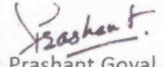

The test is valid between 10 Weeks to 13 weeks & 6 days of gestation.

Dual or Double marker test in first trimester, identifies pregnancies that have a high risk of babies having the following chromosomal abnormalities:

1. Trisomy 21 (Down syndrome)
2. Combined Trisomy 13 (Patau syndrome)/ Trisomy 18 (Edwards syndrome)

This Screening test is NOT a diagnostic test (it cannot tell whether the baby has any of the above conditions); it only identifies the risk of the baby being affected. A confirmatory test may be needed when the screening test is positive (high risk)

The interpretive unit is MoM (Multiples of Median) which takes into account variables such as gestational age (ultrasound), maternal weight, race, insulin dependent Diabetes, multiple gestation, IVF (Date of Birth of Donor, if applicable), smoking & previous history of Down syndrome. Accurate availability of this data for Risk Calculation is critical.

REMARKS
Down Syndrome

This patient's relative risk for Down syndrome has been determined by dividing the assay results by the average analyte level in twin pregnancies, and then calculating the risk associated with a singleton pregnancy. This relative risk calculation places the patient below the screening cut-off for Down syndrome.
