DIAGNOSTICS & SPECIALTY CLINICS

Your Right to Right Healthcare...

Laboratory | Radiology | Polyclinic | Pharmacy

Barcode No **89781183**
Patient Name **Mr.RAJ KUMAR**
Age/Sex **52 YRS/Male**
Referred By **SELF**
Cl

Lab No **16952501310006**
Reg Date **31/Jan/2025 09:14PM**
Sample Coll. Date **31/Jan/2025 08:15 PM**
Sample Rec.Date **01/Feb/2025 10:39 AM**

Report Date **01/Feb/2025 03:31PM**

.IMMUNO BIOCHEMISTRY-1

Test Name With Methodology	Result	Unit	Biological Ref.Interval
Hepatitis B surface antigen (HBsAg) ECLIA			
Hepatitis B Surface Antigen(HBS Ag) ECLIA	0.431	COV	< 0.90 Negative

Serum, Electro Chemi Luminescent Immuno Assay

COMMENTS:

For diagnostic purposes, the results should always be assessed in conjunction with the patient's medical history, clinical examination and other findings. This immunoassay for the in vitro qualitative determination of hepatitis B surface antigen (HBsAg) in human serum and plasma.

Hepatitis B is a potentially life-threatening liver infection caused by the hepatitis B virus (HBV). It is transmitted through contact with the blood or other body fluids of an infected person. Hepatitis B surface antigen (HBsAg) is a polypeptide component of the external envelope of HBV, presenting various immunogenic determinants. After infection, HBsAg is the first immunologic marker detectable in serum and is usually present weeks before the onset of clinical symptoms and the appearance of other biochemical markers.

Barcode No	89781183	Lab No	16952501310006
Patient Name	Mr.RAJ KUMAR	Reg Date	31/Jan/2025 09:14PM
Age/Sex	52 YRS/Male	Sample Coll. Date	31/Jan/2025 08:15 PM
Referred By	SELF	Sample Rec.Date	01/Feb/2025 10:39 AM
		Report Date	01/Feb/2025 12:31PM

Test Name With Methodology	Result	Unit	Biological Ref.Interval
Hepatitis C virus-Total Antibodies (ECLIA)			
Hepatitis C Total Ab (Anti-HCV) ECLIA Serum, Electro Chemi Luminescent Immuno Assay	0.04	COI	<0.9 Non-Reactive 0.9 to < 1.0 Borderline 1.0 Reactive

Comments:

Hepatitis C (HCV) is an RNA virus of Flavivirus group transmitted via blood transfusions, transplantation, injection drug users, accidental needle punctures in healthcare workers, dialysis patients and rarely from mother to infant. 10% of new cases show sexual transmission. As compared to HAV & HBV, chronic infection with HCV occurs in 85% of infected individuals. In high risk populations, the predictive value of Anti HCV for HCV infection is > 99% whereas in low risk populations it is only 25%.

Note:

1. The Anti-HCV Antibody assay is an in vitro diagnostic test for the **qualitative** detection of antibodies to hepatitis C virus (HCV) in human serum and plasma.
2. False positive results are seen in Autoimmune diseases, Rheumatoid factor, Hypergammaglobulinemia, Paraproteinemia, passive antibody transfer, Anti- idiotypes & Anti superoxide dismutase
3. False negative results are seen in early Acute infection, Immunosuppression & Immuno-incompetence.
4. HCV RNA PCR recommended in all Reactive results to differentiate between past and present infection.

Uses: Indicator of past or present infection, but does not differentiate between Acute / Chronic / Resolved infection ?
Routine screening of low and high prevalence populations including blood donors.
