HSV 1&2 IgG CLIA	36.10	AU/ML	<2.0 Negative.

Comment:

CMV is infection in most cases does not cause severe illness. It may pass to the fetus during the birth process. A positive IgG antibody result indicates a probable past or present infection. A positive IgG result at the onset of illness may indicate that the patient had exposure more than a month ago and/or may have occurred years prior to this current illness. IgG levels in two blood samples drawn 2-3 weeks apart if shows increasing trend may indicates present infection. Stable IgG levels may be associated with past infection. A negative result indicates absence of detectable levels of IgG antibodies
