.IMMUNO BIOCHEMISTRY-1

Test Name With Methodology	Result	Unit	Biological Ref.Interval
PSA Free/PSA Total Ratio			
Prostate Specific Antigen [Free] Serum, Electro Chemi Luminescent Immuno Assay	2.62	ng/ml	0.04-0.50
PSA [TOTAL]	8.21	ng/ml	0 - 4.00
Free PSA/Total PSA Ratio	0.32	Ratio	

Interpretation

This test helps in the detection of prostate cancer when used in conjunction with a digital rectal exam in men age 50 and older. The Elevated PSA concentrations can only suggest the presence of prostate cancer until biopsy is performed. PSA concentrations can also be elevated in benign prostatic hyperplasia or inflammatory conditions of the prostate. PSA is generally not elevated in healthy men or men with non-prostatic carcinoma.

The free PSA percentage is an aid in distinguishing prostate cancer from benign prostatic conditions in men age 50 and older with a total PSA between 3 and 10 ng/mL and negative digital rectal examination findings. Prostatic biopsy is required for the diagnosis of cancer. (Refer to: JAMA 1998; 279: 1542-1547)

In patients with total PSA concentrations of 4-10 ng/mL, the probability of finding prostate cancer on needle biopsy by age in years is:

% Free PSA	50-59 years	60-69 years	70 years and older
0-10%	49%	58%	65%
11-18%	27%	34%	41%
19-25%	18%	24%	30%
> 25 %	9%	12%	16%

Other factors may help determine the actual risk of prostate cancer in individual patients.
