COMMENTS:

For diagnostic purposes, the results should always be assessed in conjunction with the patient's medical history, clinical examination and other findings. This immunoassay for the in vitro qualitative determination of hepatitis B surface antigen (HBsAg) in human serum and plasma.

Hepatitis B is a potentially life-threatening liver infection caused by the hepatitis B virus (HBV). It is transmitted through contact with the blood or other body fluids of an infected person. Hepatitis B surface antigen (HBsAg) is a polypeptide component of the external envelope of HBV, presenting various immunogenic determinants. After infection, HBsAg is the first immunologic marker detectable in serum and is usually present weeks before the onset of clinical symptoms and the appearance of other biochemical markers.
