## .IMMUNO BIOCHEMISTRY-1

| Test Name With Methodology                                               | Result | Unit | Biological Ref.Interval |
|--------------------------------------------------------------------------|--------|------|-------------------------|
| <b>CCP Antibodies (Anti Cyclic Citrullinated Peptide Antibody)</b>       |        |      |                         |
| Anti CCP<br><small>Serum, Electro Chemi Luminescent Immuno Assay</small> | <8.0   | U/ml | <17 Negative            |

### COMMENT:

This test detects the presence of anti CCP antibodies in the serum. Anti-citrullinated protein/peptide antibodies (ACPAs) are autoantibodies (antibodies directed against one or more of the individual's own proteins) frequently detected in rheumatoid arthritis patients. Recently, these antibodies have turned up as powerful biomarkers, which are accepted as a major diagnostic tool in diagnosing rheumatoid arthritis (RA) already in a very early stage of disease.

In patients with symptoms of rheumatoid arthritis, testing positive for both CCP antibodies and RF suggest that a patient is likely to have rheumatoid arthritis. Testing positive for CCP antibodies and negative for RF may indicate that a patient is likely to develop rheumatoid arthritis in the future or is already in the early stages. Testing negative for both CCP antibodies and RF indicates that a patient is less likely to have rheumatoid arthritis.
