COMMENT:

CK-MB levels, along with total CK, are tested in persons who have chest pain to diagnose whether they have had a heart attack. Since a high total CK could indicate damage to either the heart or other muscles, CK-MB helps to distinguish between these two sources. The level of CK-MB in blood help to determine the efficacy of a clotdissolving drug in the following way: When the clot dissolves, CK-MB tends to rise and fall faster.

If the value of CK-MB is elevated and the ratio of CK-MB to total CK (relative index) is more than 2.5-3, it is likely that the heart was damaged. A high CK with a relative index below this value suggests that skeletal muscles were damaged.
