HAEMATOLOGY

Test Name With Methodology

Haemoglobin HPLC

Test Name With Methodology	Result	Unit	Biological Ref.Interval
Hb F(Foetal Hb) Level	1.2	%	< 2.0
Peak 2	4.6	%	
Peak 3	0.4	%	<10
Hb A0	81.6	%	
HbA2	2.9	%	1.9 - 3.5
Hb D (Punjab)	0.0	%	<0.02
Hb Sickle	0.0	%	<0.02
Hb C	0.0	%	<0.02
Hb E	0.0	%	<0.02
Opinion	Normal Pattern		
Advise	Please Correlate Clinically		

Comment:

Haemoglobinopathy is a kind of genetic defect that results in abnormal structure of one of the globin chains of the hemoglobin molecule. Hemoglobin variants are abnormal forms of hemoglobin. All results have to be correlated with age and history of blood transfusion. If there is history of blood transfusion in last 3 months, repeat testing after 3 months from last date of transfusion is recommended. **In case of hemoglobinopathy, parents or family studies, DNA Analysis and Genetic counseling is advised.**

- ~ **P3 window-** Above 10% is often indicative of either denatured forms of hemoglobin (degenerated sample) or may suggest a possibility of abnormal hemoglobin variant. Hence, repeat analysis with fresh sample or DNA studies is advised.
- ~ **P2 window-** Above 10% is indicative of either glycated hemoglobin requiring correlation with diabetic status or may suggest a possibility of abnormal hemoglobin variant requiring further DNA studies for confirmation.
- ~ Screening of the spouse are strongly recommended, if pregnant woman have hemoglobinopathy.
- ~ This test detects Beta thalassemia and hemoglobinopathies. DNA analysis is recommended to rule out alpha thalassemia and silent carriers.
- ~ Mild to moderate increase in **fetal hemoglobin (HbF)** can be seen in some acquired conditions like Pregnancy, Megaloblastic anemia, Thyrotoxicosis, Hypoxic conditions, Chronic kidney disease, Recovering marrow, MDS, Aplastic anemia, PNH, Medications (Hydroxyurea, Erythropoietin, Butyrates) etc.
- ~ Iron deficiency Anemia may be associated with **low HbA2** result and may mask thalassemia condition also.
- ~ **Elevated levels of HbA2** are seen in Beta-Thalassemia, and also in other conditions like Sickle cell Alpha-Thalassemia, Megaloblastic Anemia, Unstable Hemoglobinopathies, Zidovudine- treated HIV patients, Congenital Dyserythropoietic Anemia (CDA) type 1 and Hyperthyroidism.

*Results relate only to the sample, as received.

Report Date 15/Mar/2025 12:16PM

Test Name With Methodology	Result	Unit	Biological Ref.Interval
Rubella IgG (CLIA)	IMMUNOASSAY		
Rubella IgG CLIA	25.80	IU/ML	<2.0 Negative.

Comments :

This test is used to estimate the levels of IgG antibodies against Rubella. Rubella is the virus that causes German measles. If contracted early in the pregnancy, the infant may develop heart disease, retarded growth, hearing loss, blood disorders, vision problems, or pneumonia. Problems that may develop during childhood include central nervous system disease, immune disorders, or thyroid disease. A positive IgG antibody result indicates a probable past or present infection. A positive IgG result at the onset of illness may indicate that the patient had exposure more than a month ago and/or may have occurred years prior to this current illness. IgG levels in two blood samples drawn 2-3 weeks apart if shows increasing trend may indicates present infection . Stable IgG levels may be associated with past infection.A negative result indicates absence of detectable levels of IgG antibodies.
